

CASSIA

Chat-based Accounting System for SQL, Search, Insight & Analysis

A chat-based accounting support workspace for small-business follow-up work.

The client-questions, agency-notices, and follow-up side of a practice — distinct from bookkeeping, reconciliation, and calculation tools. CASSIA brings your books, the documents you upload, and everything you’ve saved before into one place, and reasons across all of it.

ASK → RETRIEVE → VISUALIZE → SAVE → ORGANIZE → RECALL → FOLLOW UP

Features & what they mean for your practice

Twelve capabilities, each mapped to a real moment in follow-up work and the reason it matters.

Hybrid LLM routing

ASK

Every question is auto-classified to SQL, document search (RAG), both, or your saved Core.

One chat box, four engines. Ask for numbers, policy, both, or your own past work — CASSIA picks the path. No “modes” to learn.

Text-to-SQL over your books

RETRIEVE

Plain-English questions become real SQL against the accounting database.

The analyst who never forgets a JOIN. A question returns the answer, a chart, and a plain-English explanation — no formulas, no pivot tables.

Cited answers from IRS docs & your uploads

RETRIEVE

RAG over IRS Pub 15 / 15-T / 15-B and any notice or memo you upload, with page numbers.

Defensible, not guessed. Every policy answer points back to the source page you can hand to a client or reviewer.

Upload-aware data querying

RETRIEVE

CSV/Excel uploads become live tables the router queries alongside the books.

Drop in a client’s spreadsheet and ask. CASSIA knows an uploaded file is data, not just an attachment, and queries it in the same conversation.

Charts on demand

VISUALIZE

Bar, line, and pie charts rendered on any SQL result via Plotly.

Client-deck-ready in one line. “...as a bar chart” turns a query into a visual you can paste straight into a report.

Core saves — durable findings

SAVE

Any answer or upload can be committed to a permanent, per-user knowledge base.

Save it once, keep it forever. Findings leave the scrollback and become part of your workspace instead of getting lost in chat history.

Semantic recall across sessions

RECALL

Embedded saves are recalled by meaning, not keywords, in any future session.

Your reasoning, searchable months later. “What did I save about AR collection?” surfaces the right finding even from a chat you closed weeks ago.

Topic grouping (Outlook-style)

ORGANIZE

Sessions and saves share one topic namespace, grouped in a collapsible sidebar.

File by client and issue the way you already work. The folder pattern accountants use for email, applied to your analysis.

Persistent sessions & auto-titles

FOLLOW UP

Sessions persist to disk; each gets an auto-generated title in the user’s language.

Close the tab, pick up days later. Every session, save, and topic is still there — a workspace, not a disposable chat.

Multi-user auth & per-user isolation

TRUST

Invite-only accounts; defense-in-depth isolation at the API and the vector store.

One practice’s data never bleeds into another’s. Ownership is enforced twice over, so a single bug can’t expose a client’s records.

Honest limits

TRUST

When a question is outside its sources, CASSIA says so and asks for the document.

Trust over bluffing. It would rather tell you to upload the notice than invent an answer — the behavior you need around tax and compliance.

Multilingual flow

BILINGUAL

Questions and session titles work across languages (e.g. Korean and English).

Built for bilingual practices. Ask in Korean, get Korean answers and a Korean session title — no context switching.
